

Clinical Supply Chain and CDMO Network Overview

Loblolly Ridge Therapeutics | CMC & Clinical Supply | 2026-08-10

How clinical and development supply moves through Loblolly Ridge's outsourced manufacturing network: from the API manufacturers to drug-product manufacture, packaging, depots and sites, and to our licensee. It explains who does what at each node, how forecasts and campaigns are planned, how material is released, how safety stock is held and where the backup API supplier project stands. Issued August 10, 2026.

Network map

LRT-1107 API is made by Tessaro Fine Chemicals in Italy and drug product by Northgate Pharma Services in Ontario. Clearwing Clinical Supply packages, labels and distributes to depots in the United States and the Netherlands, which supply CANOPY-1 and CANOPY-OLE sites. The diagram also shows Hanlin Pharmatech as a second API source; Hanlin is in qualification and is not yet approved to supply.

Roles by node

Tessaro Fine Chemicals (API CDMO, Italy): LRT-1107 API; LRT-3318 drug substance for our licensee; GMP API for LRT-4051.

Northgate Pharma Services (drug-product CDMO, Canada): LRT-1107 drug product; LRT-4051 clinical drug product.

Clearwing Clinical Supply: packaging, labelling, depots and distribution to sites.

Brookmoor Analytical: analytical methods and stability testing, including for LRT-4051.

Cobalt RTSM (IRT): randomization and dispensing data that drive resupply.

CMC & Clinical Supply: forecasting, campaign planning and partner management. Quality Assurance: release.

Forecasting and campaign planning

CMC & Clinical Supply refreshes the LRT-1107 clinical supply forecast monthly from IRT randomization and dispensing data and plans API and drug-product campaigns 12 to 18 months ahead of need. The forecast covers both CANOPY-1 and CANOPY-OLE, and is reviewed with Clinical Operations when the enrollment forecast changes.

Release and quality

Quality Assurance releases each drug-product lot for clinical use after reviewing the executed batch record and certificate of analysis, and releases packaged and labelled kits before they ship to depots. Quality agreements with each CDMO set out who is responsible for what under CGMP; FDA guidance describes a quality agreement as separate from commercial terms such as price. All manufacturing, testing and supply partners are risk tier 1 and are audited before first use and every 24 months.

Safety stock

Loblolly Ridge keeps at least six months of forecast LRT-1107 drug-product demand as safety stock across the U.S. and EU depots. No site has run out of study drug.

Supply to our licensee

Castellane Pharma runs development of LRT-3318. Until technology transfer to Castellane's manufacturer completes, targeted for March 2027, we supply drug substance at a transfer price. Deliveries in 2026 were 6.0 kg on February 24 and 8.5 kg on June 23; the next, 8.5 kg, is scheduled for November 20.

Backup API supplier

Tessaro is the only qualified API source for LRT-1107. Hanlin Pharmatech in China is being qualified as a backup. Its qualification audit took place on June 9, 2026; acceptance of the audit response is planned for mid-August and the qualification batch for December 2026. Hanlin will not supply clinical material until QA approves it.
