

Issued production definitions sheet

Mesa Lantern Energy LLC | Production Accounting | 2026-09-26

This issued sheet defines the volume terms used in the pilot's reviewed well-day extract. This draft is prepared for finance and operations as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

Oil includes lease condensate and is stated in barrels; raw gas is stated in Mcf. The internal boe view applies a six-Mcf-to-one-boe arithmetic convention. Month-end views distinguish the frozen close from later restatements. An average daily rate needs both the calendar-day denominator and an explicit statement of how many well-days contributed.

Production stream definitions

The modeled field ledger holds oil, including lease condensate, in stock tank barrels and raw gas in thousand cubic feet at its measurement point. The internal barrel-of-oil-equivalent view uses six Mcf of gas for one boe. That ratio is a reporting conversion only; it does not make gas and oil economically or energetically identical. Processed natural gas liquids are not attributed to individual wells in this extract.

Production measure

For a reviewed well-day, internal boe is oil barrels plus raw gas Mcf divided by six. A month total sums the included reviewed daily records; an average daily rate divides by calendar days and must be paired with a coverage indicator. Because this pilot extract samples well-days, neither its total nor its average can be presented as Mesa Lantern's full operated production without an explicit coverage method.

Coverage and missing values

The proposed extracts end on August 31, 2026. Production rows represent selected well-days, about 32 of 118 modeled wells per day on average, so their sums are not companywide production totals. Some meter or downtime values may be null, with a reason where available. A missing value is excluded from a numeric calculation and must never be silently treated as zero.

Monthly close boundary

Production Accounting freezes the monthly reporting snapshot on the tenth business day after month end. Changes after that point use a dated adjustment record rather than overwriting the frozen view. A reader comparing two months must therefore distinguish the original close from a later restatement view. The reporting period and extraction date are both necessary to interpret a number.

Record question for review

Before putting a boe figure into a slide, verify that the gas input is raw gas in Mcf and that the oil input is barrels. Add the six-to-one arithmetic rule and the sample coverage beside the figure. The calculation does not create a new measured stream.

Review action and handoff

These definitions allow a reader to reproduce the meaning of a field in a workbook. They do not turn a selected sample into the operator's full production, and they do not attribute processed NGLs to wells. If another document uses an undefined stream or period, the author should correct that document before circulation.

Companion extract summary

The accompanying summary is calculated from the selected records in this extract. Read its period, contributing-record count, and units before comparing values. It does not substitute for the record-level definitions and coverage limitations described above.

Measure	oil_bbl
Unit	bbl
Total	1897172.35
Mean	251.148
Records	7554
Period	2026-01-01 to 2026-08-31

Measure	raw_gas_mcf
Unit	Mcf
Total	11407916.6
Mean	1506.9903
Records	7570
Period	2026-01-01 to 2026-08-31
