

Daily production capture guide

Mesa Lantern Energy LLC | Field Operations | 2026-09-26 | v0.1-draft

This guide describes what a field operator enters, what Production Accounting reviews, and how a question about a reading is sent back to the source. This draft is prepared for field operators as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

A daily entry must identify the well, local production date, oil and raw-gas streams, and the observed meter reference when available. Field Log is the first record; Production Ledger is the reviewed record. When a value is unavailable, mark it missing rather than entering zero. The operator should preserve the original observation when clarification produces a correction.

Daily field-to-ledger path

Field operators enter well readings in Field Log by the next morning. Production Accounting compares those entries with Meter Historian readings, records exceptions, and posts reviewed values to Production Ledger. A correction preserves the first entry and a reason for the change. The review path matters because a later extract should be traceable to the reading and decision that produced it.

Production stream definitions

The modeled field ledger holds oil, including lease condensate, in stock tank barrels and raw gas in thousand cubic feet at its measurement point. The internal barrel-of-oil-equivalent view uses six Mcf of gas for one boe. That ratio is a reporting conversion only; it does not make gas and oil economically or energetically identical. Processed natural gas liquids are not attributed to individual wells in this extract.

System roles and handoffs

Field Log and Meter Historian feed the reviewed Production Ledger. Inspection Register and Work Register exchange references when a finding leads to maintenance. Vendor Ledger carries contractor transactions. Reporting Mart receives read-only exports for monthly summaries; it does not write changes back to operational systems. Source entries and timestamped revisions remain in those systems, which is why a report should name its extraction date.

Record linkage

Synthetic well, asset, location, vendor, work-order, and project keys connect the proposed datasets. Business users should see natural asset and project names where possible, while the keys preserve joins across extracts. A linked inspection and work order should refer to the same asset instance and location. A record without a valid link should be flagged for review rather than attached to the nearest plausible item.

Coverage and missing values

The proposed extracts end on August 31, 2026. Production rows represent selected well-days, about 32 of 118 modeled wells per day on average, so their sums are not companywide production totals. Some meter or downtime values may be null, with a reason where available. A missing value is excluded from a numeric calculation and must never be silently treated as zero.

Record question for review

When a meter reference is missing, leave the reference blank with the available reason and send the reading for review. Entering a zero gas value would create a different claim: that the measured quantity was zero. The guide protects that distinction at the point of entry.

Review action and handoff

The operator's handoff ends when the entry is available for the next-morning comparison. A review flag is a request to explain evidence, not permission to replace a reading silently. For this pilot, the shared production extract is a selection of well-days and cannot substitute for a full field log.
