

Issued asset integrity responsibility guide

Mesa Lantern Energy LLC | Asset Integrity | 2026-09-26

This guide assigns responsibility for inspection findings, work prioritization, and verified closeout. This draft is prepared for district supervisors as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

An inspector records a finding; Asset Integrity decides priority; a field supervisor checks readiness for the task; and a verifier closes the work record. Those stages should remain visible even when one visit addresses several observations. Inspection and work-order identifiers connect evidence but do not collapse the two processes into one event.

Work-order route

A field request is tied to an asset and location. The integrity lead prioritizes it, and a supervisor confirms isolation and contractor readiness where needed. Completion is not inferred from a planned date: closeout requires a completion date, downtime record, and verifier. That sequence supports a distinction between an open request, work in progress, and a verified closed order.

Inspection-to-work path

Inspection Register holds scheduled and ad hoc checks of meters, tanks, compressors, and pads. An observation may open a linked work order, but the two records answer different questions: the inspection records what was seen and the work order records the response. Overdue observations stay open until a named owner verifies closure. A scheduled check without a finding need not create maintenance work.

Maintenance measures

Backlog is the count of open work orders at period end. An overdue order has a due date before that point and is not cancelled. Verified downtime hours are summed only where recorded; a blank duration is unknown rather than zero. Those definitions prevent an early extract from making the outstanding workload or the cost of disruption look smaller than the underlying records allow.

Decision owners

Field Operations is led by Avery Collins. Robin Vega is accountable for production accounting, Morgan Hale for asset integrity, Taylor Kim for development projects, and Casey Nolan for supply and contractor records. These assignments identify who can explain a record or approve a correction. They do not imply that one person performs every underlying field task or that another team may change a source record without its owner.

Record linkage

Synthetic well, asset, location, vendor, work-order, and project keys connect the proposed datasets. Business users should see natural asset and project names where possible, while the keys preserve joins across extracts. A linked inspection and work order should refer to the same asset instance and location. A record without a valid link should be flagged for review rather than attached to the nearest plausible item.

Record question for review

If an inspection finding is still open, identify whether the missing step is work execution or observation verification. Route the first to the work-order owner and the second to the observation owner. The guide is meant to stop a common handoff confusion between those two steps.

Review action and handoff

For reporting, describe open and overdue orders using the stated period-end rule and preserve null downtime. A district can use this guide to route an unresolved observation to the right person without presuming that a date alone proves field completion.
