

Issued source-record custody note

Mesa Lantern Energy LLC | Production Accounting | 2026-09-26

This note explains which systems hold original entries and what a reporting copy is permitted to do. This draft is prepared for data governance group as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

Field Log and Meter Historian contribute readings to the reviewed Production Ledger. Other operational registers keep their own work, inspection, and vendor histories. Reporting Mart takes read-only exports. A correction belongs in the source process, with its original entry and timestamped revision retained, before a changed view is circulated.

System roles and handoffs

Field Log and Meter Historian feed the reviewed Production Ledger. Inspection Register and Work Register exchange references when a finding leads to maintenance. Vendor Ledger carries contractor transactions. Reporting Mart receives read-only exports for monthly summaries; it does not write changes back to operational systems. Source entries and timestamped revisions remain in those systems, which is why a report should name its extraction date.

Monthly close boundary

Production Accounting freezes the monthly reporting snapshot on the tenth business day after month end. Changes after that point use a dated adjustment record rather than overwriting the frozen view. A reader comparing two months must therefore distinguish the original close from a later restatement view. The reporting period and extraction date are both necessary to interpret a number.

Adjustment lineage

A production adjustment points back to the original daily record, names the stream being corrected, and keeps both original and revised values with a posting date and reason. Adjustments posted after the monthly freeze belong to a restatement view. Analysts should not add both the original and revised quantity when preparing a summary; they should select a declared version of the record.

Record linkage

Synthetic well, asset, location, vendor, work-order, and project keys connect the proposed datasets. Business users should see natural asset and project names where possible, while the keys preserve joins across extracts. A linked inspection and work order should refer to the same asset instance and location. A record without a valid link should be flagged for review rather than attached to the nearest plausible item.

What the client extract can show

The proposed files are selective extracts from modeled operational registers through August 31, 2026. Reporting Mart can bring those copies together without changing a source system. The package can explain definitions, ownership, and recorded activity within that window. It cannot establish complete history, unrecorded field conditions, or companywide production from a selected well-day sample.

Record question for review

A report generated after a source correction may disagree with an earlier frozen month. Keep both extraction dates and the adjustment reference visible. Deleting the earlier value from the explanation would obscure what the team knew at the time of the original close.

Review action and handoff

A custody review should trace a record from source through review to reporting copy and identify the extraction date. If the copy and source differ, preserve both versions while the owner explains whether the difference is timing, a correction, or a broken link.
