

Issued operating measure definitions

Mesa Lantern Energy LLC | Production Accounting | 2026-09-26

This reference defines the three pilot measure families and the denominators required to read them. This draft is prepared for reporting analysts as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

Production boe converts raw gas at six Mcf per boe and needs a count of contributing well-days. Maintenance backlog counts open orders at period end; cancelled items do not count as overdue. Inspection closure divides closed observations by those due in the period, excluding future-due items. Verified downtime sums recorded hours and leaves null entries unresolved.

Production measure

For a reviewed well-day, internal boe is oil barrels plus raw gas Mcf divided by six. A month total sums the included reviewed daily records; an average daily rate divides by calendar days and must be paired with a coverage indicator. Because this pilot extract samples well-days, neither its total nor its average can be presented as Mesa Lantern's full operated production without an explicit coverage method.

Maintenance measures

Backlog is the count of open work orders at period end. An overdue order has a due date before that point and is not cancelled. Verified downtime hours are summed only where recorded; a blank duration is unknown rather than zero. Those definitions prevent an early extract from making the outstanding workload or the cost of disruption look smaller than the underlying records allow.

Inspection closure measure

The closure rate divides observations closed by observations due in the reporting period. Items with future due dates are outside the denominator, even if entered during the period. An analyst should preserve open, closed, and not-applicable states separately and inspect linked work orders before explaining a change in the rate. The measure describes recorded closeout, not the absence of physical defects.

Coverage and missing values

The proposed extracts end on August 31, 2026. Production rows represent selected well-days, about 32 of 118 modeled wells per day on average, so their sums are not companywide production totals. Some meter or downtime values may be null, with a reason where available. A missing value is excluded from a numeric calculation and must never be silently treated as zero.

Record question for review

When two teams quote a different overdue count, check the period-end date, cancelled-order treatment, and whether the due-date comparison uses a strict earlier-than rule. The dispute may be definitional rather than an error in the source register. Keep the record list available to resolve it.

Review action and handoff

Every chart or table should state source file, period, extraction date, unit, and denominator. A change in a measure can reflect changed coverage or record status. Do not attribute it to field performance until the contributing records and definitions have been compared.

Companion extract summary

The accompanying summary is calculated from the selected records in this extract. Read its period, contributing-record count, and units before comparing values. It does not substitute for the record-level definitions and coverage limitations described above.

Measure	downtime_hours
Unit	hours
Total	158229.36
Mean	121.5279
Records	1302
Period	2026-01-01 to 2026-08-31
