

EDW Nightly Loads and Interface Schedule

*Tallowbrook Health | Decision Support & Operational Reporting | 2026-03-15
| v1.4*

Interface description, version 1.4, March 15, 2026. Owner: Priya Raman, Director, Decision Support & Operational Reporting, with the IS integration team. Lists each feed into the enterprise data warehouse (EDW), its timing and dependencies, and what happens when a load fails.

1. Load window

EDW loads run nightly between 1:00 and 5:30 a.m. Source extracts land first, transformations run next, and Pulse dashboards refresh at the end of the window so that figures are available when managers arrive.

File transfers are managed by the integration engine, which also handles HL7 feeds between the EHR and ancillary systems.

2. Feeds

- EHR ADT and bed management (nightly, 1:00 a.m.): admissions, transfers, discharges, midnight census, bed assignments and observation status for both hospitals.
- EHR ED and orders (nightly, 1:20 a.m.): ED arrivals, dispositions and admission order times used for boarding hours.
- EHR enterprise scheduling (nightly, 1:40 a.m.): templates, booked and completed appointments for the Pavilion, Stafford and Mission Bend, and surgical schedules for both hospitals.
- WFS (nightly, 2:30 a.m.): scheduled and worked hours by employee, cost center and pay code. Worked hours also go to ERP payroll each pay period.
- ERP (nightly, 3:00 a.m.): purchase orders, receipts, inventory issues and general ledger postings.
- Enterprise CMMS (weekly, Sunday 3:30 a.m.): assets and work orders for clinical engineering at the Fort Bend and outpatient sites, and facilities work orders for all sites.
- Legacy CE CMMS (monthly, manual): Clinical Engineering exports devices and work orders for Medical Center West and the Pavilion in the first week of the month; Decision Support loads the file.
- Surgery center case summary (monthly file): cases by service and room from the surgery center practice-management system, received by the tenth of the month.

3. Dependencies

Census, boarding and discharge timing dashboards need both EHR feeds. Staffing dashboards use WFS data after each pay period closes, because late punches and corrections post during the following week.

- Equipment maintenance figures for Medical Center West and the Pavilion are up to a month behind other sites because of the manual export.
- Surgery center volumes appear in facility activity reports only after the monthly file arrives.

4. Failure handling

The integration engine alerts the on-call Decision Support analyst when an extract is late or fails validation. The analyst reruns the load by 7:00 a.m. where possible.

If a rerun is not possible, affected dashboards show the prior day's data with a banner, and the analyst notifies report owners by email.

- Row-count checks compare each feed with the prior seven days and flag changes over 20%.
- Failed loads and reruns are logged in the Decision Support operations log.

5. Change control

New feeds or changes to timing are requested through IS and reviewed by the architecture review board before build. Version 1.4 moves the WFS extract from 4:00 to 2:30 a.m. so that staffing views refresh before the 5 a.m. staffing huddle.
