

Clinical Engineering Program Report, January–August 2026

Tallowbrook Health | Clinical Engineering | 2026-09-10

Report to the Environment of Care committee and the Chief Operating Officer, September 10, 2026. Prepared by Samuel Ibekwe, Director, Clinical Engineering. Covers work orders opened January 1 to August 31, 2026 and the equipment register at August 31.

Summary

Scheduled maintenance completion was 96.1% for the eight months, above the 95% target, and every high-risk PM due was completed on time. July fell to 91.7% and recovered in August. The CMMS consolidation was approved in June and data cleanup is under way.

Equipment inventory

1,680 devices were on file at August 31: 1,576 active, 44 out of service and 60 pending retirement. 969 records are in the legacy CE CMMS (Medical Center West and the Pavilion) and 711 in the enterprise CMMS (all other sites).

Risk class: 434 high, 437 medium, 809 low.

1,188 devices carry an AEM category default; the rest follow manufacturer schedules, including all imaging equipment, lasers and high-risk life-support devices.

53 records (3.2%) have no model number, which slows recall searches; these are part of the cleanup.

Work orders

2,950 work orders were opened: 1,694 scheduled maintenance, 849 corrective repairs, 202 incoming inspections, 88 recall or alert actions and 117 closed as no problem found. Technicians recorded 4,181 hours and \$125,188 in parts.

Measure	labor_hours
Unit	hours
Total	4180.8
Mean	1.4172
Records	2950
Period	2026-01-01 to 2026-08-31

Measure	parts_cost
---------	------------

Unit	USD
Total	125188.29
Mean	42.4367
Records	2950
Period	2026-01-01 to 2026-08-31

Scheduled maintenance completion

Completion is measured as PM work orders completed by their due date over PM work orders due. 1,427 of 1,485 PM work orders due by August 31 were completed on time (96.1%), including 402 of 402 high-risk (100.0%).

By system: legacy CMMS sites 96.3%, enterprise CMMS sites 95.9%. Monthly results were 96.4% to 97.2% except July, when two technician vacancies and vacation coverage left 18 low- and medium-risk PMs late.

Repairs and recalls

Infusion pumps (123), physiologic monitors (120) and suction regulators (102) had the most corrective repairs. The median corrective repair was closed seven days after it was opened.

126 work orders were open at August 31. Of the 91 open PM work orders, 90 were not yet due; one low-risk PM (a blood glucose meter due August 28) was overdue.

88 recall or alert work orders were opened; four remained open at August 31, all awaiting vendor parts.

Staffing

The department has 13 budgeted FTEs across the Medical Center West and System Service Center shops. Both technician vacancies were filled in August.

CMMS consolidation

The business case was approved in June 2026. Data cleanup runs July to October 2026, focusing on device types, missing model numbers and records for retired devices. Migration of legacy records is planned for January to April 2027.
