

Retail Electric Provider Service Guide

Sedgewater Energy Holdings | Customer and Market Operations | 2026-06-01

This guide explains how retail electric providers (REPs) work with Sedgewater Electric Delivery: what Sedgewater does and does not do, how service orders and usage flow, how outages are reported and whom to contact. It is published for REPs operating in the Sedgewater service area. Edition of June 1, 2026.

1. Our role

Sedgewater Electric Delivery is a transmission and distribution service provider (TDSP) in the ERCOT region. It builds, operates and maintains poles, wires, substations and meters, restores outages and processes service orders. It does not generate electricity or sell it to end-use customers.

In ERCOT, a TDSP owns or operates transmission or distribution facilities for compensation, is regulated by the PUCT, must provide non-discriminatory access and registers with ERCOT. The rates TDSPs charge are set by the PUCT.

2. Customers, REPs and charges

58 REPs are active in the service area. REPs bill end-use customers and pay Sedgewater its regulated delivery charges; Sedgewater invoices REPs each business day. A TDSP's delivery charge can include base transmission and distribution rates, DCRF, TCRF, energy-efficiency and securitization charges.

Residential and small commercial distribution rates are mainly energy-based, most large commercial and industrial rates are based on peak demand, and every REP pays the same rates.

3. Service orders

REPs submit move-ins, move-outs, switches, disconnects and reconnects for non-payment, re-reads and investigations through the market transaction gateway. Most are completed remotely through the meter network. TX SET 814 transactions carry enrollments, switches, move-ins and move-outs; 867 transactions carry usage.

Sedgewater returns a service-order response within one retail business day when it rejects an order or cannot complete it. In 2025 REPs submitted 1,179,882 service orders; 98.7% of completed orders were completed by the requested date and 91% were completed remotely.

4. Usage and invoices

Final usage (867_03) goes to ERCOT within three business days of the meter read. The usage transaction and the TDSP invoice (810_02) are usually paired to trigger the REP's customer billing.

5. Outages and hazards

Customers should report outages and hazards to Sedgewater, not to their REP. Each REP chooses how customer outage calls reach Sedgewater: by transaction, by forwarding calls, or by giving customers the Sedgewater outage number. Sedgewater's electric contacts cover outages, hazards, meter access, streetlights and service-order questions; billing questions go to the REP.

6. Critical care and critical load

REPs requesting disconnection of critical load or critical care customers must coordinate with Sedgewater before the order is worked.

7. Storms and system outages

During Level 1 and Level 2 storm activations Sedgewater issues a REP bulletin at every restoration update. Market procedures also cover extended unplanned market-system outages; Sedgewater sends market notices for its own system outages.

8. Contacts

Market Operations help desk: weekdays 7 a.m. to 7 p.m.

Monthly REP forum: second Tuesday of each month.

Construction and new-service escalations: newservice-escalations@ (mailbox to be assigned).
