

Contractor Management and Field Safety Requirements

Sedgewater Energy Holdings | Contractor Management with Safety, Health and Environment | 2026-02-02

These requirements apply to every contractor working for Sedgewater Electric Delivery or Sedgewater Gas Distribution under a master service agreement. They cover prequalification, releases and approvals, field audits, safety rules and storm work. Issued by Contractor Management on February 2, 2026; shared with contractor safety leads.

1. Who this applies to

Sedgewater has 34 contractors under master service agreements covering line construction, underground and boring, pole inspection, vegetation, gas construction, locating, traffic control and contact overflow. Subcontractors must meet the same requirements and be named on the release.

2. Prequalification

Each contractor holds one of three statuses. Approved contractors may receive releases in their scope. 'Approved - conditional' means a corrective safety plan is in place; releases continue but audits increase. Suspended contractors may not receive new releases, and their open work is reassigned.

Rate tiers A, B and C reflect scope size and audit history. Pinehaven Line Services has been conditionally approved since February 2026 with a corrective safety plan.

3. Releases and approvals

All work is authorized through a release that sets the contractor, program, district, funding and authorized value. Work orders must reference an active release.

Release approval limits: district managers up to \$250,000; directors up to \$2 million; vice presidents up to \$10 million; the COO above \$10 million.

4. Field safety audits

Sedgewater audits contractor crews in the field at least monthly for tier A contractors and quarterly for tier B and C, and weekly while a contractor is conditionally approved. Audits are recorded on form SHE-F-112 revision B and shared with the contractor's safety lead within five working days.

5. Safety rules

Line work follows OSHA 1910.269 for the operation and maintenance of transmission and distribution lines and equipment. Contractors report every recordable injury, DART case, vehicle incident and high-potential near miss to Sedgewater within 24 hours. The 2026 employee TRIR

target of 1.40 is also the benchmark used in contractor performance reviews.

6. Storm work

During activations contractors follow Sedgewater's restoration priorities: public safety hazards first, then registered critical facilities, substations and main feeders, laterals and individual services. Storm releases are issued by storm command and close when crews are released.

7. Workforce

Qualified line workers are scarce: about 131,900 people held power-line installer and repairer jobs in the United States in 2025, with median pay of \$95,320 in May 2025, and about half work for utilities. Contractors must keep crew rosters current so that storm command can plan capacity.
