

Issued information request response

Mesa Lantern Energy LLC | Production Accounting | 2026-09-26

This response lists what the modeled company is making available for the initial engagement and where questions should be directed. This draft is prepared for engagement manager as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

The handoff includes selected production and adjustment records, maintenance and inspection records, contractor mobilizations, an asset snapshot, and project milestones. The accompanying guides explain ownership, units, period close, and record linkage. Reporting Mart exports are copies of operational systems. The packet is a selective view of routine operations rather than a complete enterprise archive.

What the client extract can show

The proposed files are selective extracts from modeled operational registers through August 31, 2026. Reporting Mart can bring those copies together without changing a source system. The package can explain definitions, ownership, and recorded activity within that window. It cannot establish complete history, unrecorded field conditions, or companywide production from a selected well-day sample.

Decision owners

Field Operations is led by Avery Collins. Robin Vega is accountable for production accounting, Morgan Hale for asset integrity, Taylor Kim for development projects, and Casey Nolan for supply and contractor records. These assignments identify who can explain a record or approve a correction. They do not imply that one person performs every underlying field task or that another team may change a source record without its owner.

Operating boundary

Mesa Lantern Energy is modeled as a private onshore operator with two districts: High Plains in western Oklahoma and Red Mesa in the Texas Panhandle. Four named pads stand for the field footprint in this pilot. The 118 producing wells, roughly 16,400 boe per day, and 74 employees describe the modeled business at the reference date; they are planning context, not measurements from the supplied extracts.

Coverage and missing values

The proposed extracts end on August 31, 2026. Production rows represent selected well-days, about 32 of 118 modeled wells per day on average, so their sums are not companywide production totals. Some meter or downtime values may be null, with a reason where available. A missing value is excluded from a numeric calculation and must never be silently treated as zero.

System roles and handoffs

Field Log and Meter Historian feed the reviewed Production Ledger. Inspection Register and Work Register exchange references when a finding leads to maintenance. Vendor Ledger carries contractor transactions. Reporting Mart receives read-only exports for monthly summaries; it does not write changes back to operational systems. Source entries and timestamped revisions remain in those systems, which is why a report should name its extraction date.

Record question for review

If the engagement team asks for full historical well output, answer with a coverage gap rather than a larger-looking sum from the sample file. The response tells them which additional source and period would be needed and which owner can clarify the request.

Review action and handoff

The engagement team should return specific questions with file, period, business key, and observed issue. Mesa Lantern can then route them to the relevant owner. Requests for full historical coverage, complete well population, or a verified companywide metric require additional records not supplied here.
