

Issued operating scope memorandum

Mesa Lantern Energy LLC | Field Operations | 2026-09-26

This issued memorandum fixes the pilot operating boundary used by the other files in the handoff. This draft is prepared for engagement sponsor as part of Mesa Lantern Energy's initial information handoff. It describes the modeled operation at the stated date and should be read with the period and coverage of its supporting records.

Purpose and immediate use

The two modeled districts and four named pads provide enough structure to interpret location labels. The workforce and well counts are scenario assumptions at the reference date, not an independent field census. Each departmental record has an owner and a distinct meaning. The asset register is a dated snapshot, while transaction extracts describe selected activity through August.

Operating boundary

Mesa Lantern Energy is modeled as a private onshore operator with two districts: High Plains in western Oklahoma and Red Mesa in the Texas Panhandle. Four named pads stand for the field footprint in this pilot. The 118 producing wells, roughly 16,400 boe per day, and 74 employees describe the modeled business at the reference date; they are planning context, not measurements from the supplied extracts.

Decision owners

Field Operations is led by Avery Collins. Robin Vega is accountable for production accounting, Morgan Hale for asset integrity, Taylor Kim for development projects, and Casey Nolan for supply and contractor records. These assignments identify who can explain a record or approve a correction. They do not imply that one person performs every underlying field task or that another team may change a source record without its owner.

What the client extract can show

The proposed files are selective extracts from modeled operational registers through August 31, 2026. Reporting Mart can bring those copies together without changing a source system. The package can explain definitions, ownership, and recorded activity within that window. It cannot establish complete history, unrecorded field conditions, or companywide production from a selected well-day sample.

Coverage and missing values

The proposed extracts end on August 31, 2026. Production rows represent selected well-days, about 32 of 118 modeled wells per day on average, so their sums are not companywide production totals. Some meter or downtime values may be null, with a reason where available. A missing value is excluded from a numeric calculation and must never be silently treated as zero.

Record question for review

When a copied workbook is circulated alone, a reader might mistake its four pad names for a complete site inventory. This memorandum supplies the boundary: the pads are representative scenario locations and the extracts are selective. Attach the scope whenever a table leaves the original packet.

Review action and handoff

Use this memorandum to check whether a question falls inside the supplied scope. If an analysis needs all wells, earlier months, or unmodeled facilities, request a different extract. The memorandum should travel with the files so a separated workbook is not mistaken for a complete operating record.
